Charity Dupont

Agentic UX Designer

Bridging behavioral science and technical execution to design agentic AI ecosystems that translate complex human intent into sophisticated, reliable partnerships.

Education: B.A. in Psychology

Origin: Chicago native, raised in New Jersey

Focus: Systems Thinking and AI Products

Philosophy: Understanding how technology reshapes everyday user behavior

CASE STUDY 01

Luna

Designing Behavior for Agentic AI

An interaction model for making AI behavior understandable, predictable, and trustworthy.

ROLE

UX Designer &
Researcher

LENGTH

3-day sprint

The Agentic Gap

Everyone can join and transcribe. No one communicates behavior , that is the gap.

Capabilities	Zoom AI	Microsoft Copilot	Project Luna
Join Meetings	✓	✓	✓
Transcribe	✓	✓	✓
Answer Questions & Take Action	✓	✓	✓
Communicate Behavioral Presence	✗	✗	✓

▲ THE CORE PROBLEM

Designing Non-Verbal Communication

Humans constantly signal intent before speaking.

Eye contact.

Breathing.

Pauses.

Movement.

AI should do the same.

I designed behavioral cues that reduce uncertainty.

Signaled intent lowers cognitive load. Luna restores the missing nonverbal cues through motion, color, and animation.

Giving Luna a Seat in the Call

Luna's presence had to be visible to everyone, not because she needed a tile, but because the tile removed a layer of user uncertainty.

BEFORE

AI beside the conversation

Zoom AI Companion and Microsoft Copilot can assist during a live meeting, but the AI experience remains visually separate from the people in the conversation.

The user has to look somewhere else to understand what the AI is doing, what it has captured, or how it is responding.

The AI could participate in the meeting, but it didn't have a visible seat in it.

DECISION

Luna inside the meeting

Her presence and state became part of the shared meeting context. Users could see where she was, what state she was in, and when she was participating without leaving the call.

WHAT IT SOLVED

Fewer steps. Less context switching. Less ambiguity. Luna's behavioral presence became legible in the same place the work was happening.

Product principle: AI presence should reduce cognitive load, not create another place to look.

From Meeting Tool to Teammate

Today's meeting AI assist the meeting. Luna participates in it.

AI Assists

AI sits along the conversation. Summarizing answering and capturing.

AI Participates

Luna is part of the conversation, listening, understanding the context and contributing in the moment

*The shift wasn't just where AI appeared. It was what AI became.
Luna didn't belong beside the meeting — she belonged inside of it.*

Giving Luna a Seat in the Call

Presence had to be literal. For Luna to feel like a teammate, she couldn't live in a side window , she had to appear in the meeting itself, as a participant everyone can see.

1

Guest participant

Luna appears as her own tile in the call, right alongside the people.

2

Joins like a guest

She enters the meeting the way any guest does through the browser, no extra hardware.

3

Always in view

Her state stays visible in the call, so the team never wonders what she's doing.

A seat in the call changes everything.

Luna became a real participant: visible, present, in the room.

Directing the System

The image is a collage of various elements related to a software development project. On the left, there are two vertical strips of code snippets from a text editor. Above the main text area is a progress bar showing a play icon, a series of vertical bars of varying heights, and the text '0:00 / 1:33'. The main text area contains a heading 'Worked for 2m >', a paragraph 'I have implemented the optimizations to solve the delays and duplicate process issue', and two numbered sections: '1. Low-Latency and Deduplication Improvements' and '2. Process Manager and Duplication Fix inside the Call'. Each section contains a list of bullet points describing specific improvements. To the right of the text is a list of updates, numbered 1 through 3, detailing changes to the code and interface. Below the text is a 'Review' button with a document icon. On the far right, there are two side-by-side screenshots of a web application. The left screenshot shows a 'Quick Portal' with a 'Joining Luna' button. The right screenshot shows a video call interface with a participant named 'Charity Dupont (she / her)' and a chat panel at the bottom. At the bottom left, there is a small text box with a play icon and the text '0:00 / 1:26', followed by a paragraph of text and a list of two numbered sections: '1. Active Call Detection' and '2. Auto-Join Server Route'. At the bottom right, there is a large text box with the text 'Natural language became a design medium. I directed AI to rapidly prototype, validate, and refine interaction behavior.'

Idea → build one → test → observe → refine → repeat. Hundreds of micro-decisions — every one was a design call.

Bridging Design and Engineering

Luna runs locally while Google Meet runs inside Chrome. Understanding how those environments communicate was essential to designing a real meeting experience.

Technical concepts I needed to understand

HOW I LEARNED

To make informed product decisions, I taught myself the fundamentals through documentation, engineering conversations, experimentation, and rapid prototyping/

I learned enough engineering to lead the product, not to become an engineer.

Making Invisible States Visible

Every AI has invisible states. Most AI hides them. Luna exposes them , that's the innovation.

Listening *"I'm being heard"*

soft purple
calm, ambient, trustworthy; slow motion so
attention never feels like surveillance

Reasoning *"it's thinking"*

brighter purple
shimmering particles , thinking made visible,
replacing dead air

Speaking *"it's talking"*

green
the 'live' cue we already trust from mic and
record lights

Trust grows when internal state becomes externally visible.

Luna, Live

Live capture — listening, reasoning, and speaking states in motion during a real call

Results & Impact

What happened after I presented this work.

01

Validated the gap

My team agreed the missing behavioral states were a real oversight worth solving.

02

Shaped the product

The team chose to move Luna directly into Google Meet instead of keeping her in a standalone hub.

03

Expanded the mandate

The initiative extended my scope to additional projects, including 3D rendering explorations.

Impact doesn't have to be a launch , a validated oversight, a product decision, or new scope all show the difference this work made.

Design Principles I Learned

- Designing AI means designing behavior.
- Behavior is part of the product architecture.
- Trust depends on legibility.
- Interaction precedes intelligence.
- The strongest AI experiences communicate intent before action.

Luna explores how behavioral design can transform an intelligent system into a trusted collaborator.

CASE STUDY 02

Bank of Daniel

Digital Receipt

Turning completed transactions into reusable shopping lists.

ROLE

UX Designer & Researcher

LENGTH

1 Week

TYPE

End-to-end Product

Your bank shows the money , not what you bought.

Turn a completed transaction into a useful, understandable record of what was actually bought.

j

TODAY — A BLACK BOX

Tap a transaction and you see a dollar amount, date, type, and card number. No context , you don't know what you actually bought.

See only the amount, date, type, and card number.

Search across email, retailer apps, and paper receipts to reconstruct a purchase.

Memory what was bought without the context needed to make the transaction useful.

PRODUCT DIRECTION — A GLASS BOX

One place to see the amount and the itemized receipt , aggregated across every vendor. No app-hopping.

See the items behind the transaction, not just the dollar amount.

Find the receipt and purchase context in one place.

Reuse completed purchases as a shopping list for the next trip.

One view. One purchase history. One place to act.

From Payment to Purchase Context

Connect the receipt to the transaction so I can see what I bought and turn individual items into a shopping list.

THE PROBLEM

The transaction isn't enough

A transaction tells me where, when, and how much I paid but not the items I purchased.

The receipt is disconnected

The details I need may live in email, a retailer app, or a paper receipt instead of with the payment.

The purchase is hard to use

Even when I find the receipt, I still have to manually turn individual items into a shopping list.

Because payment completes the transaction , not the user's task.

After I pay, I may still want to understand what I bought and organize the items I care about. The experience can continue from the payment into the purchase.

The transaction is already the natural anchor.

I'm already in my banking app looking at the purchase. Attaching the receipt keeps payment and purchase context together and gives me a path to act on the items.

TRANSACTION

—

RECEIPT

—

ITEM

—

SHOPPING LIST

The transaction is only the starting point. It doesn't tell me what I bought.

The purchase is disconnected

The transaction contains payment information, but not the item-level details behind the purchase.

The receipt lives somewhere else

Customers leave the banking app to find receipts, initiate returns, or check what they purchased.

The information has to be reconstructed

When customers want to buy something again or resolve a purchase, they find the same information across multiple places.

TODAY, TAPPING A TRANSACTION
SHOWS ONLY:

Transaction Date

Transaction Type

Card Number

Find the purchase behind the transaction.

Search by merchant or item, or open a transaction directly. The purchase details are connected to the transaction.

Search by what you remember

Search by merchant or item instead of remembering when the transaction occurred.

Open any transaction

Tap a transaction as you always have date, type, and card number are still there.

The receipt is attached

Scroll down on the transaction to see the itemized receipt, pulled in from the merchant.

Keep shopping lists connected to your purchases.

Saved items live in one place and remain connected to the transactions they came from.

Manage lists

Open “My Lists” alongside your accounts and manage saved items in one place.

Add context

Add a size, color, or personal note to an item.

Keep the purchase connected

Every saved item links back to the original transaction for purchase details.

Remove an item

Remove items when they are no longer relevant.

Build lists for what you'll buy next.

Create lists from items you've already purchased and organize them for future shopping.

Create a list

Start with any saved item and organize it around a need, store, or occasion.

Make it recurring

Reuse a list for routines like weekly grocery shopping.

Organize by purpose

Keep lists separate by store, project, or occasion.

A transaction becomes a starting point.

Less searching

Purchase information stays connected to the transaction.

More useful transactions

A completed purchase can become the source for a future shopping list.

More value from existing data

Merchant-provided purchase details can make transaction history more useful to customers.

Bank of Daniel already tells me where my money went.

This experience helps me remember what I bought — and turn it into a shopping list for later.

04 · WRAP UP

Thank you.

Designing AI means designing behavior and behavior is where trust begins.
