

A BUILD JOURNEY

Luna 2.0

Meet Companion

A vision for an intuitive, interactive AI presence in live meetings. Luna 2.0 operates as an evolving companion that participates in the room.

Charity Dupont AIUX designed the vision · **Agentic Coding** wrote the code

WHERE IT STARTED

The spark

I began by exploring the potential of AI agents in live environments. Inspired by an early prototype from a colleague, I identified an opportunity to enhance the interaction model, moving from a standard agent to a more sophisticated, participant-focused companion.

The goal was to understand the underlying infrastructure and expand the possibilities of live meeting participation.

Getting an agent into a live Google Meet is a unique challenge, and that just made me want to try.

“If he could put an agent inside a call , I wanted to know how.

And I wanted to explore and see if there was potential to do more.”

WHAT I WANTED

Project Vision

1

Seamless Integration

A companion that joins meetings effortlessly.

2

Visual presence

A dynamic, responsive visual indicator to ensure the AI remains an approachable presence in the room.

3

Conversational Voice

Engaging, open-ended dialogue that moves beyond scripted interactions.

*To elevate the standard of AI participation in **real-time** collaboration.*

HOW I WORKED

My vision, JetSki's engineering

I led the vision and product strategy. So I kept a clear line between the two sides of this build. What I wanted, and how it got solved.

What I brought

- The vision for what Luna should be
- Product judgment on how she should behave
- The decisions on what to build next
- Knowing when “good enough” wasn't

What JetSki brought

- The architecture
- The code, end to end
- The debugging through every roadblock
- Platform Integration Strategy

Every phase in this story is told the same way: what I needed → what we built.

Why Luna had to be split

To optimize performance and resource management, the application architecture was modularized. By distributing tasks across client-side extensions, a **lightweight middleware**, and backend services, we ensure a responsive experience within the browser environment.

THE ORB · THREE STATES

Luna, in three states

Listen → *think* → *speak* — the split loop, made visible.

LISTENING

Solid orb — she's in the room, taking it in.

THINKING

Pixels scatter as she reasons over what was said.

SPEAKING

Glow green as she answers out loud.

THE JOURNEY

Six phases, build by build

1

Base platform & calendar
auto-join

2

Guest accessibility &
conversational flow

3

Headless operation & interface
optimization

4

Streamlined connectivity &
protocol optimization

5

Advanced AI reasoning (Vertex AI)

6

Voice output refinement

PHASES 1-3

Standing Luna up

1

Base platform & auto-join

I wanted A hub that joins Meet from my calendar automatically.

We built A robust Node/Express server infrastructure, a centralized dashboard, and automated scheduling workflows.

2

Guest join + interruption

I wanted Streamlined meeting access for guests and a responsive, natural participant interaction model.

We built Implemented a direct guest connection protocol and dynamic interruption handling to ensure a smooth, attentive experience.

3

Headless + sidebar

I wanted Efficient background performance and organized meeting management.

We built Optimized audio filtering, cross-origin communication protocols, and a dedicated agenda panel for clarity..

Easy to deploy, able to think

4

Rapid connectivity

I wanted Versatile, link-based meeting access.

We built A streamlined connectivity portal and utilized robust bridge protocols to ensure stable and flexible integration across meeting environments.

5

Vertex AI brain

I wanted Fluid, open-ended conversational intelligence.

We built Integrated the Gemini 2.5 Flash model via Vertex AI to process meeting context and deliver low-latency, natural responses

6

Voice optimization

I wanted Consistent and reliable live voice interaction.

We built Conducted iterative refinements to ensure stable, high-quality audio transmission throughout the session

Navigating Platform Evolution

Authentication & Accessibility

The struggle Streamlining entry workflows for efficiency.

The fix Implemented an optimized guest-access protocol, prioritizing rapid availability.

Interface Consistency

The struggle Maintaining stable data observation during frequent UI updates.

The fix Transitioned from dynamic class selectors to semantic DOM attributes (e.g., ARIA labels) to ensure consistent element tracking.

Data Processing Logic

The struggle Encountered edge cases where standard validation checks occasionally misinterpreted empty data objects.

The fix Enhanced architectural logic with explicit length verification to ensure precise data capture.

Strengthening Audio Integration

Infinite captions loop

The struggle The automated control logic encountered state synchronization issues when interacting with the interface toggle, leading to unintended activation loops.

The fix Read the button's tooltip label instead ("Turn on / off captions").

Cross-Origin Audio Delivery

The struggle Aligning audio retrieval with background process standards.

The fix Implemented a standardized message-passing architecture, facilitating compliant and secure audio delivery.

Background process leaks

The struggle Unscheduled session terminations occasionally resulted in residual background processes, creating potential resource management inefficiencies.

The fix Developed an automated lifecycle routine that performs systematic cleanup upon session completion, ensuring consistent stability and optimal resource utilization.

WHAT I TOOK FROM IT

What this build taught me

Clear separation of vision and architecture accelerates velocity

I owned the vision and the judgment calls; JetSki owned the code. That split actually worked.

Resilience is critical to stability

Adapting to rapid interface evolution was a primary engineering focus

“Good enough” was never the goal

Every phase started from the same place: I want it to do more than it does right now.

Complexity can often be a barrier to stability

Identifying and removing unnecessary processes, such as simplifying authentication, often serves as a catalyst for overall progress and usability.

WHERE LUNA GOES NEXT

Taking up more of the space

The original goal still drives it , make Luna do more inside the call.

From reactive to participant Enhancing capabilities to support agenda management, provide real-time summaries, and offer proactive follow-up insights

Tougher against change Hardening observer logic to ensure consistent performance even as platform interfaces continue to evolve

A presence with personality Further tuning visual and vocal cues to foster an approachable and recognizable companion experience for all participants.

Broader Accessibility Evolving the architecture to support flexible, multi-environment access beyond localized hardware configurations.

Luna 2.0 represents more than just a functional tool; it is an evolving presence that will continue to grow in utility, intuitiveness, and intelligence.

True progress is achieved not through simple replication, but through the persistent pursuit of more seamless, valuable human-AI collaboration.
